overlap relationships among clones to be deduced.
However, it should not be assumed that this clone will be sequenced to completion. In the event that the record is updated, the accession number will
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             sequencing reads that have not been assembled into contigs. Runs of N are used to separate the reads and the order in which they appear is completely arbitrary. Low-pass sequence sampling is useful for identifying clones that may be gene-rich and allows
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            NOTE: This record contains 92 individual

NOTE: Estimated insert size may differ from sequence length
(see http://www.hgsc.bcm.tmc.edu/docs/Genbank\_draft\_data.html).

NOTE: This is a 'working draft' sequence. It currently

consists of 61 contigs. The true order of the pieces

is not known and their order in this sequence record is

arbitrary. Gaps between the contigs are represented as

runs of N, but the exact sizes of the gaps are unknown.

This record will be updated with the finished sequence

as soon as it is available and the accession number will

 Current sequence finishing criteria for the C. elegans genome sequencing consortium are that all bases are either sequenced unambiguously on both strands, or on a single strand with both a dye primer and dye terminator reaction, from distinct subclones. Exceptions are indicated by an explicit note.

EXCEPTIONS are indicated by an explicit note.

It may be shorter because we only sequence overlapping sections
 Submitted (23-JUN-1995) Nematode Sequencing Project, Sanger Institute, Hinxton, Cambridge CB10 1SA, England and Department of Genetics, Washington University, St. Louis, MO 63110, USA, E-mail: jes@sanger.ac.uk or rw@nematode.wustl.edu COding sequences below are predicted from computer analysis, using predictions from Genefinder (P. Green, U. Washington), and other
 neighbouring

 Mus musculus
 Unpublished
 NOTE: This record contains 83 individual sequencing reads that have not been assembled into contigs. Runs of N are used to separate the reads and the order in which they appear is completely arbitrary. Low-pass sequence sampling is useful for identifying clones that may be gene-rich and allows overlap relationships among clones to be deduced. However, it should not be assumed that this clone.
 will be sequenced to completion. In the event that
 the record is updated, the accession number will

chemistry, or covered by high quality data (i.e., phred quality >30); an attempt was made to resolve all sequencing problems, such
as compressions and repeats; all regions were covered by sequence
as compressions and repeats; all regions were covered by restriction digest.

## MAPPING INFORMATION:

The position of this clone was established as part of a collaboration between the Human Chromosome Y Mapping Project (Tomoko Kawaguchi, Helen Skaletsky, Laura G. Brown, Steve Rozen, and David C. Page at the Whitehead Institute for Blomedical Research, Cambridge MA) and the Washington University Genome Sequencing Center, St. Louis MO.

## SOURCE INFORMATION:

The RPCI-11 human BAC library was made from the blood of one male donor, as described by Osoegawa, K., Woon, P.Y., Zhao, B., Frengen, E., Tateno, M., Catanese, J.J. and de Jong, P.J. (1998) An improved approach for construction of bacterial artificial chromosome libraries. Genomics 51:1-8. The clone may be obtained either from Research Genetics, Inc. (http://www.resgen.com) or Pieter de Jong and coworkers at the Roswell Park Cancer Institute (http://bacpac.med.buffalo.edu)

NEIGHBORING SEQUENCE INFORMATION:

The clone sequenced to the left is RP11-115H13, 200 bp overlap; the clone sequenced to the right is RP11-54OC18, 200 bp overlap. Actual start of this clone is at base position 195 of RP11-196J6; actual end is at base position 30203 of RP11-54OC18.

 NOTE: This is a 'working draft' sequence. It currently consists of 22 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence.
 as soon as it is available and the accession number will

 NOTE: This is a 'working draft' sequence. It currently consists of 10 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

 requests: clonerequest(sanger.ac.uk)
On Dec 4, 2000 this sequence version replaced gi:11493251.
During sequence assembly data is compared from overlapping clones.
Where differences are found these are annotated as variations
together with a note of the overlapping clone name. Note that the
variation annotation may not be found in the sequence submission
corresponding to the overlapping clone, as we submit sequences with
only a small overlap as described above.
This sequence has been finished according to sequence map criteria
as follows. An attempt is made to resolve all sequencing problems,
such as compressions and repeats, but not necessarily within known
annotated repeat sequence elements. Where the sequence is
ambiguous, there is an annotation using the 'unsure' feature key.
The following abbreviations are used to associate primary accession
numbers given in the feature table with their source databases:
Em: EMBL; Sw:, SWISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information
on the WORMPEP database can be found at
http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence
was generated from part of bacterial clone contigs of human
chromosome 1, constructed by the Sanger Centre Chromosome 1 Mapping
Group. Further information can be found at
http://www.sanger.ac.uk/HGP/ChrI
RP11-296A18 is from the library port-11 2 constructed.

 rAlaIleLeuAlaProAsnArgTrpGlnGluIleLeuSerLeuIleIleS
 corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest. The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em: EMBL; SW:
 Cambridgeshire, CB10 18A, UK. E-mail enquiries:
humquery@sanger.ac.uk Clone requests: clonerequest@sanger.ac.uk
On Nov 15, 2001 this sequence version replaced gi:16151438.

During sequence assembly data is compared from overlapping clones.
Where differences are found these are annotated as variations
together with a note of the overlapping clone name. Note that the
variation man not be found in the sequence submission
variation annotation may not be found in the squences with
 SWISSPROT: Tr:, TREMBL; Wp:, WORMPEP; Information on the WORMPEP database can be found at http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence was generated from part of bacterial clone contigs of human chromosome 10, constructed by the Sanger Centre Chromosome 10 Mapping Group. Further information can be found at
 http://www.sanger.ac.uk/HGP/Chr10
RP11-165A20 is from the library RPCI-11.1 constructed by the group
of Pieter de Jong. For further details see
 sections only once, except for a short overlap. The true left end of clone RP11-165A20 is at 1 in this The true left end of clone RP11-80K21 is at 137492 in

 AL Submitted (19-FEB-2001) Takuji Sasaki, National Institute of Agrobiological Resources, Rice Genome Research Program; Kannondai 2-1-2; Tsukuba, Ibaraki 305-8602, Japan (E-mail:tasaski@nias.affcr.go.jp, URL:http://rgp.dna.affrc.go.jp/, Tel:81-298-38-7441, Fax:81-298-38-7468)
On Aug 9, 2001 this sequence version replaced gi:13442957.
Genes were predicted from the integrated results of the following: (October 1998 version). BLASTN2.0, BLASTN2.0 as well as SplicePredictor (October 1998 version). The genomic sequence was searched against NCBI NonRedundant protein database, nr (ftp://ncbi.nlm.nih.gov/blast/db) and the cDNA sequence database at RGP. Protein homologies of the coding regions were searched against NCBI NonRedundant protein database with BLASTR2.0 with the corresponding DDBJ accession no. and RGP clone ID. A gene with identity or significant homology to a protein but with EST protein. A gene with homology to any protein but with EST brooklogy (covering almost the entire length of partial sequence) is classified as an 'unknown' protein. A gene predicted with a gene prediction program is classified as a 'hypothetical' protein.

The orientation of the sequence is from -21M13 to M13Rev of the BAC clone. This sequence of CSJNBa0089X24 clone has an overlap with P0013F10. Detailed information on overlap and assembly quality together with annotation of this entry is available at http://rgp.dna.affrc.go.jp/GenomeSeq.html.

NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.

This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality > 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by restriction digest.

MAPPING INFORMATION:
Mapping information for this clone was provided by Dr. John D.
Mapping information for this clone was provided by Dr. John D.
McPherson, Department of Genetics, Washington University, St. Louis
MO. For additional information about the map position of this
sequence, see http://genome.wustl.edu/gsc

## SOURCE INFORMATION:

The RFCI-11 human BAC library was made from the blood of one male donor, as described by Osoegawa, K., Woon, P.Y., Zhao, B., Frengen, E., dranese, J.J. and de Jong, P.J. (1998) An improved approach for construction of bacterial artificial chromosome libraries. Genomics 51:1-8. The clone may be obtained either from Research Genetics, Inc. (http://www.resgen.com) or Pieter de Jong and coworkers at the Roswell Park Cancer Institute /http://bacpac.med.buffalo.edu)
/ECTOR: pBACe3.6

 The sequence Rel1-298E6 contains a dinucleotide (AT) repeat from base position 17640 to 17740 for which the exact length is unknown.

Assembly of the database is consistent with digest information.

Location Qualifiers
 NEIGHBORING SEQUENCE INFORMATION:
The clone sequenced to the left is RP11-194LI; the clone sequenced to the right is RP11-442O5. Actual start of this clone is at base position 1 of RP11-298E6; actual end is at base position 194372 of RP11-298E6.

 Group. Further information can be round of the first sequence as the entire insert of clone RP11-146B14 The true left end of clone RP11-169L18 is at 151570 in this sequence. The true right end of clone RP11-403H13 is at 88099 in this sequence. This sequence has been finished according to sequence map criteria as follows. An attempt is made to resolve all sequencing problems, as follows. An attempt is made to resolve all sequencing problems.
 The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:

Em: EMBL; Sw:, SWISSPROT; TT:, TREMBL; Wp:, WORMPEP; Information on the WORMPEP database can be found at http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence was generated from part of bacterial clone contigs of human chromosome 9, constructed by the Sanger Centre Chromosome 9 Mapping Group. Further information can be found at
 requests: clonerequest@sanger.ac.uk
on Sep 11, 2000 this sequence version replaced gi:10039482.
During sequence assembly data is compared from overlapping clones.
Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.
such as compressions and repeats, but not necessarily within known annotated repeat sequence elements. Where the sequence is ambiguous, there is an annotation using the 'unsure' feature key. RP11-146Bl4 is from the library RPCI-11.1 constructed by the group
 AL137020 182231 bp DNA linear PRI 03-JAN-2002 Human DNA sequence from clone RP11-146B14 on chromosome 9. Contains part of the gene KIAA0780, ESTs, STSs and GSSs, complete sequence.
 human.

ID AAF59778 standard; DNA;
 The invention relates to the Moraxella catarrhalis strain ATCC43617
CC BASB122 and BASB124 proteins (AAB60640 and AAB60641, respectively)
CC and to DNA encoding them (AAF59778 and AAF59779, respectively). The
CC invention also relates to immunogenic fragments of the BASB122 and
CC. BASB124 proteins, expression vectors and host cells comprising BASB122 or
CC BASB124 nucleic acids, the recombinant production of BASB122 or
CC COMPASB124, vaccine compositions comprising the BASB122 or BASB122 or
CC compositions comprising an antibody against BASB122 or BASB124 proteins
CC compositions comprising a Moraxella Catarrhalis infection via the
CC detection of BASB122 or BASB124 proteins or antibodies. The vaccine
CC compositions of the invention are useful as prophylactic or therapeutic
CC agents against Moraxella catarrhalis infections in mammals, particularly
CC humans. Moraxella catarrhalis is a Gram negative bacterium frequently
CC isolated from the human upper respiratory tract, which is responsible for
CC several pathological conditions. It is responsible for about 15% of
CC onsocomial infections and, less frequently, invasive diseases. BASB122 or
CC BASB124 proteins or nucleotides may additionally be used in screening for
CC infections. The present scanners are presents by NA encoding the Moravella.

US-10-048-197-2 x AAV03597
 Align seg 1/1 to: AAV03597
 AAV03575-606 represent sequences that are present in Neisseria meningitidis and N. gonorrheae but not in N. lactamica, except for the genes involved in biosynthesis of the capsule polysaccharide, frpA or C, opc, porA, rotamase, sequence IC1106, IgA protease, pillin, pilC, proteins which bind transferrin and opacity proteins. The DNA sequences are responsible for the differences in pathogenicity between N. meningitidis and N. gonorrheae, specifically they include the genes that allow N. meningitidis to cross the blood-brain barrier. DNA sequences common to N. meningitidis and N. gonorrheae, but absent from N. lactamica, are responsible for colonisation and penetration of the mucosa. The DNA sequences can be used to produce probes and primers, and antibodies produced against the encoded proteins are used in standard hybridisation/immunoassay processes for diagnosis of N. meningitidis
 Genes present in Neisseria meningitidis but not other Neisseria species - and related host cells, RNA, anti-sense sequences, polypeptide(s) and antibodies, useful for diagnosing Neisseria meningitidis infection and in protective vaccines

 The present sequence represents a genomic fragment of Neisseria meningitidis. The specificatino describes proteins that are specific for pathogenic strains of Neisseria. The polynucleotides, polypeptides, or their antigenic fragments, are used in vaccines to treat or protect against Neisseria infections, particularly by N. meningitidis. The polynucleotide sequences are also used for recombinant production of the polypeptide and to produce attenuated Neisseria strains that overexpress it, or express it in a non-toxic mutant form.

note: the present sequence is included in Claim 1, but it is those sequences that do not include the present sequence that are actually

 Streptococcus pneumoniae. The present invention also describes an CC isolated nucleic acid molecule encoding a homologue of any of the CC fragments of the S.pneumoniae genome (SEQ ID NO:1 to 391) where the CC nucleic acid molecule is produced by a process comprising: (a) screening CC a genomic DNA library using as a probe a target sequence defined by any CC of the sequences in SEQ ID NO:1 to 391, identifying members of the CI library which contain sequences that hybridise to the target sequence and isolating the nucleic acid molecules from the members; or (b) isolating CC mRNA, DNA or cDNA produced from an organism, amplifying nucleic acid molecules whose nucleotide sequence is homologous to amplification or cDNA produced from an organism, amplifying nucleic acid conclecules whose nucleotide sequence is homologous to amplification or primers derived from the fragment of the S. pneumoniae genome to prime the amplification and isolating the amplified sequences. The computer creadable medium can be used in a computer-based system for identifying CC fragments of the S. pneumoniae genome. Products from the present invention can be used in diagnosis kits and assays, and CC pharmaceutical compositions and vaccines for S. pneumoniae.

 which encode human secreted proteins. The CDNA sequences have been derived from a variety of human tissues. The invention also provides a method for producing proteins from these polynucleotide sequences. The proteins are useful for identifying compounds that modulate their activity and production, and the cell is also useful for identifying compounds that modulate expression of the polynucleotide sequences encoding the secreted proteins. The sequences of the invention are useful for treating diseases such as hyperproliferative disorders (e.g. cancer), immune deficiency disorders (e.g. severe combined
 immunodeficiency (SCID)), autoimmune disorders (e.g. multiple sclerosis), blood disorders (e.g. thrombocytopaenia), inflammatory disorders (e.g. arthritis) and infectious disorders (e.g. hepatitis) The polynucleotide sequences of the invention are also useful in get therapy. AAS62214-AAS62838 represent the CDNA sequences of the invention that encode for novel human secreted proteins.
 New polynucleotides encoding secreted proteins useful for treating e.g. asthma, {\sf HIV} and {\sf Crohn's} disease -

 A computer readable medium has been developed which has recorded on it 982 nucleotide sequences isolated from the Enterococcus faecalis genome. AAX12938 to AAX13919 represent these nucleotide sequences which are primary nucleotide sequences, also known as contigs. The computer-based system can identify fragments of the Enterococcus faecalis genome with commercial importance. The products see used to detect the presence of Enterococcus faecalis in samples. They can also be used for diagnosing Enterococcal infection in an animal and monitoring progression of disease, and for identifying agents which can be used to modulate the growth or pathogenicity of Enterococcus faecalis, or another related organism, in vivo or in vitro. In particular the polypeptides encoded by the Enterococcus faecalis nucleotide sequences
 New isolated Enterococcus faecalis polynucleotides and polypeptides - used to develop products for the detection of Enterococcus and for use in vaccines for prevention or attenuation of Enterococcus

 The present invention relates to a Moraxella catarrhalis genomic library comprising of a combination of 41 nucleic acid molecules (see AAF28514-AAF28554). The library has a number of uses described in the specification e.g. is useful for aidentifying diagnostic and therapeutic compositions. M. catarrhalis (Branhamella catarrhalis) is a large aerobic, gram-negative diplococcus, normally found among the bacterial flora of human upper airways. M. catarrhalis is known to cause acute, localised infections such as otitis media, sinusitis and bronchopulmonary infection and life-threatening, systemic diseases including endocarditis

 useful in diagnosis, prognosis, treatment, prevention, selection and evaluation of therapies for atherosclerosis including stroke, myocardial infarction, transient cerebral ischemia, mesenteric ischemia, coronary artery disease, angina pectoris, peripheral vascular disease, renal artery stenosis, and hypertension. Sequences AAC85065-85098 represent atherosclerosis-associated genes of the invention.
 Sequence 868 BP; 249 A; 207 C; 182 G; 230 T; 0 other;
 The invention provides novel atherosclerosis-associated polynucleotides and polypeptides encoded by the genes. Expression vectors and host cells for producing the polypeptides are disclosed and methods for screening or purifying ligands which specifically bind to the polypeptides are also provided. The polynucleotides are useful for treating diseases associated with the altered expression of a gene that is coexpressed with one or more known atherosclerosis-associated genes in a subject. They are

This sequence represents the complete genome sequence of the bacterium Haemophilus influenzae strain Rd. The invention relates to a computer readable medium (CRM) having recorded upon it the complete H.influenzae nucleotide sequence (I), a representative fragment of (I) or a nucleotide sequence at least 99% identical to (I). By providing the full-length genomic sequence in a computer readable form, it is possible to identify commercially important nucleic acid fragments and expression modulating fragments (EMFs) of the Haemophilus genome. The EMFs can be used to regulate the expression of a nucleic acid molecule. Vectors and altered organisms comprising the predicted ORFS can be used to produce any of the

predicted ORFS can be used to produce any of the

 polynucleotides and its complementary sequences may also be used as DNA comprehensial production of antibodies in diagnostic assays and also used in gene therapy. The polypeptides may also be used as antigens in the production of antibodies and in assays to identify modulators of polypeptide expression and activity. The polypeptides and nucleic acids may be used as nutritional supplements, to modulate cytokine and cell proliferation activity to modulate immune stimulation or suppression (e.g. for the treatment of microbial infections and autoimmune disorders such as multiple sclerosis, rheumatodid arthritis and insulin dependent diabetes), to modulate tissue growth activity (e.g. for the the composition of Parkinson's disease, Huntington's disease and Alzheimer's disease), to modulate activin and inhibit activity (e.g. for controlling fertility), to modulate chemotactic and chemokinetic activity, to modulate receptor ligand activity, to modulate inflammation and to inhibit tumour growth.

 The present sequence is the genome sequence of Listeria monocytogenes EGD-e. This sequence and fragments of this sequence are useful for selecting probes and primers for detecting genes in L. monocytogenes and related organisms, and to study genetic polymorphisms and other genomes. Proteins (ABB47297-ABB50149) expressed from the present sequence are useful for raising specific antibodies, identification of L. monocytogenes and related organisms, and for biosynthesis and biodegradation, especially biosynthesis of Vitamin B12. This sequence and proteins encoded by it are also useful for selecting compounds that monocytogenes related diseases. In addition, this sequence and proteins encoded by it are useful in pharmaceutical and vaccines compositions for the treatment or prevention of infections by L. monocytogenes and related

 CC neuroprotective, mostropic, immunomodulatory, relaxant, contraceptive, cogynaecological, cardiant and antiinflammatory activities, and can be used CC in gene therapy. The polynucleotide and proteins can be used for CC preventing, treating, or ameliorating a medical condition or in assays Cf or diagnosing a pathological condition or a susceptibility to one in a CC subject. Binding partners to the proteins and the activity of the CC proteins can be identified. The pancreatic cancer antigens can be used to CC detect, treat or prevent pancreatic disorders, especially cancer. CC Agonists and antagonists to the antigens can be screened for. The CC pancreatic cancer antigen polynucleotides can be used to design nucleic caid hybridisation probes that can be used in chromosome mapping, linkage can diagnostic methods. The proteins can be used to generate antibodies can diagnostic methods. The proteins can be used to generate antibodies can diagnostic methods. The proteins can be used to generate antibodies contins can be used to treat or prevent neural, immune system, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal or proteins can be used in the exemplification of the present invention.

 The patent discloses novel plant gene from Arabidopsis thaliana, designated SDS, which is associated with a failure to maintain homologue attachment during meiotic prophase I. The SDS gene is located on chromosome I and is useful in plant breeding to produce male sterile SDS mutants and cloned progeny by apomixis where meiosis is bypassed in seed production. The gene may also be used as a probe to identify related genes in other plant species, and to identify and isolate other genes of the meiosis regulatory pathway. The present sequence is a cDNA encoding Arabidopsis thaliana cne materials.
 A new plant gene from Arabidopsis, designated SDS, mutations in which are associated with inability to produce pollen, is useful for the production of male sterile plants for plant breeding -

The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end
 Claim
 Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs -

Quality:
 CC sequence and an oligonucleotide comprising a sequence complementary to a CC polynucleotide which comprises a 3 -end sequence, where the CC coligonucleotide comprises at least 15 nucleotides and the combination of the 5 -end sequence/3 -end sequence is selected from those defined in CC the primer sets can be used in antisense therapy and in gene therapy. The primer sets can be used in antisense therapy and CC particularly full-length cDNAs. The primers are also useful for the CC detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length CC cDNAs easily without any specialised methods. AAH03166 to AAH13628 and CC AAB95893 represent human amino acid sequences; and AAH13629 to AAH13632 crepresent oligonucleotides, all of which are used in the exemplification of the present invention.

 The present invention describes a computer readable medium which has CC the nucleotide sequences SEQ ID NO:1 to 391 (AAV52134 to AAV52524) CC recorded on it, or a representative fragment or a sequence at least 95% CC identical to SEQ ID NO: 1 to 391. The nucleotide sequences depicted in CC SEQ ID NO:1 to 391 (AAV52134 to AAV52524) are genomic fragments from CC streptococcus pneumoniae. The present invention also describes an CC isolated nucleic acid molecule encoding a homologue of any of the CC isolated nucleic acid molecule encoding a homologue of any of the CC isolated nucleic is produced by a process comprising: (a) screening CC interactive fragments of the Sequences in SEQ ID NO:1 to 391, where the CC isolating the nucleic acid molecules from the members; or (b) isolating the nucleic acid molecules from the members; or (b) isolating CC molecules whose nucleotide sequence is homologous to amplification and isolating the amplified sequences. The computer CC readable medium can be used in a computer-based system for identifying cf fragments of the S. pneumoniae genome. Products pharmaceutical compositions and vaccines for S. pneumoniaes.

 The present sequence is modified yeast delta-9 desaturase pl-olel gene comprising a desaturase domain and a cyt b5 domain, and customised for expression in a plant cytoplasm. This gene is modified for expression in harabidopsis and related species to obtain transgenic plants that produce a higher yield of unsaturated fatty acids. Transgenic plants, especially oil plants, are produced by this method which have increased amounts of unsaturated, particularly mono-unsaturated fatty acids, to obtain foodstuff that is more healthy and has improved flavour.
 New synthetic desaturase gene, useful produce a higher yield of unsaturated expression in a plant cytoplasm -

 The present sequence is a coding sequence for human keratinocyte growth factor (KGF-2). KGF-2 can be used to stimulate epithelial cell proliferation in a patient, where the patient has a wound, mucositis, an ulcer, inflammatory bowel disease, liver disorder, lung damage, diabetes, oral injury, gastrointestinal injury, gut toxicity, epidermolysis bullosa, skin graft, skin disorder, renal failure, brain injury, breast tissue injury, urothelial damage, female reproductive tract disorder, intestinal fibrosis, proctitis, pulmonary fibrosis, peunrumonitis, plural retraction, haemopoietic syndrome, and myelotoxicity. In addition, KGF-2 can be used in the treatment or prevention of ovary injury, infertility, or fibrosis of the liver. KGF-2 also promotes internal healing, donor site healing, internal surgical wound healing or healing of incisional wounds made during cosmetic surgery in a patient.

 * NOTE: This record contains 61 individual

* sequencing reads that have not been assembled into

* contigs. Runs of N are used to separate the reads

* and the order in which they appear is completely

* arbitrary. Low-pass sequence sampling is useful for

* identifying clones that may be gene-rich and allows

* overlap relationships among clones to be deduced.

* However, it should not be assumed that this clone

* will be sequenced to completion. In the event that

* the record is updated, the accession number will

* be preserved.
 Submitted (22-NOV-2001) Whitehead Institute/MIT Center for Genome Research, 320 Charles Street, Cambridge, MA 02141, USA All repeats were identified using RepeatMasker: Smit, A.F.A. & Green, P. (1996-1997) http://ftp.genome.washington.edu/RM/RepeatMasker.html

 Meneus, I., Mihova, T., Mlenga, V., Murphy, T., Naylor, J., Nguyen, C., Norbu, C., Norman, C.H., O'Connor, T., O'Donnell, P., O'Neil, D., Oliver, J., Peterson, K., Phunkhang, P., Pierre, N., Pollara, V., Raymond, C., Retta, R., Rieback, M., Riley, R., Rise, C., Rogov, P., Roman, J., Rosetti, M., Roy, A., Santos, R., Schauer, S., Schupback, R., Seaman, S., Severy, P., Spencer, B., Stange-Thomann, N., Stojanovic, N., Strauss, N., Subramanian, A., Talamas, J., Tastaye, S., Theodore, J., The
 sequencing reads that have not been assembled into contigs. Runs of N are used to separate the reads and the order in which they appear is completely arbitrary. Low-pass sequence sampling is useful for identifying clones that may be gene-rich and allows overlap relationships among clones to be deduced. However, it should not be assumed that this clone

134092 162167: contig of 2006 bp in length
162168 162267: gap of 100 bp
162268 165412: contig of 3145 bp in length.
 NOTE: This is a 'working draft' sequence. It currently consists of 5 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will
 be preserved.

 This sequence was finished as follows unless otherwise noted: all regions were double-stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by more than one M13 subclone; and the assembly was confirmed
 CLONE LENGTH: This sequence represents the entire insert of this clone unless otherwise noted. If there are overlapping

 CLONE LENGTH: This sequence represents the entire insert of
this clone unless otherwise noted. If there are overlapping
clones, the overlaps are noted in the beginning and end of
 This sequence was finished as follows unless otherwise noted: all regions were double-stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest
 the

 findPhrapList
 NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).

NOTE: This is a 'working draft' sequence. It currently consists of 19 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

AL Submitted (24-MAY-1999) Da-Qiao Ding, Communications Research Laboratory, Kansai Advanced Research Center; 588-2, Iwaoka, Iwaoka-cho, Nishiku, Kobe, Hyogo 651-2401, Japan (E-mail:ding@crl.go.jp, Tel:+81-78-969-2240, Fax:+81-78-969-2249) An S. pombe gene library in which genomic DNA fragments are fused to the 5'-end of the GFP-5657 gene was constructed. S. pombe strain of those transformat with the library DNA amplified in E.coli, Plasmids were isolated, and their nucleotide sequences were determined. Petailed information and images can be seen in our web site (http://www-karc.crl.go.jp/bio/CellMagic/). Note: Only major localization is described for each clone in most cases. Because it subcellular localization of the fusion protein may differ from that subcellular localization of the fusion protein may differ from that subcellular localization of the fusion protein may differ from that subcellular localization of the fusion protein may differ from that subcellular localization of the fusion protein may differ from that subcellular localization of the fusion protein may differ from that subcellular localization of the fusion protein may differ from that subcellular localization of the fusion protein may differ from that subcellular localization of the fusion protein may differ from that subcellular localization of the fusion protein may differ from that subcellular localization of the fusion protein may differ from that subcellular localization of the fusion protein may differ from that subcellular localization of the fusion protein may differ from that subcellular localization of the fusion protein may differ from that subcellular localization of the fusion protein may differ from that subcellular localization of the fusion protein may differ from that subcellular localization subcellular local

Full Length cDNA of gene F13E7_19/AT3g02870 (GI:6728975) unpublished
 847 bp mRNA linear PLN 26. Arabidopsis thaliana putative myo-inositol monophosphatase (F13E7_19/AT3g02870) mRNA, complete cds.
 The Salk, Stanford, PGEC (SSP) Consortium members constructed and sequenced the pUNI (ORF) clones using the RAFL cDNAs: Yamada, K., Banh, J., Banno, F., Chang, E., Dale, J.M., Goldsmith, A.D., Lee, J.M., Onodera, C.S., Quach, H.L., Tang, C.C., Toriumi, M., Wu, H.C., Yamamura, Y., Yu, G., Yu, S., Bowser, L., Chen, H., Cheuk, R., Jones, T., Karlin-Neumann, G., Kim, C., Koeseman, E., Lam, B., Lin, J., Meyers, M.C., Miranda, M., Nguyen, M., Palm, C.J., Shinn, P., Southwick, A., Tracy, S.E., Davis, R.W., Ecker, J.R. and Theologis, A.
 Submitted (15-NOV-2001) Plant Gene Expression Center, 800 Buchanan Street, Albany, CA 94710, USA.
The RIKEN Genomic Sciences Center (GSC) members carried out the collection and clustering of RAFL cDNAs (RAFL cDNA: 'RIKEN Arabidopsis Full-Length cDNA'): Seki,M., Narusaka,M., Ishida,J., Satou,M., Kanniya,A., Sakurai,T., Carninci,P., Kawai, J., Hayashizaki,Y. and Shinozaki,K.
 Arabhdopsis thaliana
Eukaryota; Viridiplantae; Streptophyta; Embryophyta; Tracheophyta;
Spermatophyta; Magnoliophyta; eudicotyledons; core eudicots;
Rosidae; eurosids II; Brassicales; Brassicaceae; Arabidopsis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              //note="Vector: pBluescript SK-; Site_1: EcoRT; Site_2: XhoI; cDNA was prepared from 2ug of poly A+ RNA. EcoRI-XhoI cut cDNA was then ligated into UniZap-XR (Stratagene) with EcoRI at the 5' end and XhoI at the 3' end. SS-library phagemids were prepared by mass excision from the original library and normalized by hybridization to biotinylated driver (prepared from the same library by PCR) to Cot-omega of 11. After removal of hybrids and excess driver by streptavidin sepharose chromatography, the ss-phagemids were made double stranded and electroporated into Top-10 F'. Original library contruction by Bruce Blumberg (Blumberg et al., 1991 Science 253, 194-196; Hawlet et al., 1995, Genes Dev. 9, 1907-1918 and 1918 the stranded and contruction by Bruce Blumberg (Blumberg et al., 1991 Science 253, 194-196; Hawlet et al., 1995, Genes Dev. 9, 1907-1918 and 1918 the stranded and control to the

Parasitized erythrocytes were purified from contaminating host leukocytes by filtration of ADP activated blood through acid-washed glass beads and Whatman CFI1 cellulose columns by gravity filtration. Purified DNA was digested with mung bean nuclease in the presence of 42.5% formamide at 50oc as described (Galinski, M. et al. 1992. Cell 69,1213-1226; Vernick, K.D. et al. 1988. N.A.R. 16, 6883-6896). Eco RI linkers were added and the constructs ligated into Lambda ZAP III. P. vivax Belem was originally isolated from a patient in Belem, Brazil 1980 by Mercia de Arruda, adapted to Saimiri monkeys by Jurg Gysin, and maintained since 1983 in squirrel monkeys."

The sheared DNA was blunt end-repaired with 74 DNA polymerase and 74 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pMDA2 (gl14732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XI10-Gold (Stratagene) cells and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          /note-*organ: lung_normal; Vector: pucl8; Site_1: Smal; Site_2: Smal, A mini-library was made by cloning products derived from ORSTES PCR (U.S. Letters Patent application No. 196,716 - Ludwig Institute for Cancer Research) profiles into the puc 18 vector. Reverse transcription of tissue mRNA and cDNA amplification were performed under low stringency conditions.*

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      308,
                                                                                                                                                                                                                                                                                                                                                                                                                   (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gil4732114 [gb]AF129(72.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and nurified The sheared adaptors of prepared menus pure constants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                USA
                                                                                                                           : 8.00
